

Advanced Docker and final practice-Part 3

1) Deploying a Static Web Server in Docker Using Bind Mounts:

```
Terminal
PS C:\Users\sreev\mysite> echo "<h1>Hey docker guy</h1>" > index.html
PS C:\Users\sreev\mysite> ls

Directory: C:\Users\sreev\mysite

Mode                LastWriteTime       Length Name
----                <-----           ----- 
-a----   25-02-2026 15:54                 52 index.html

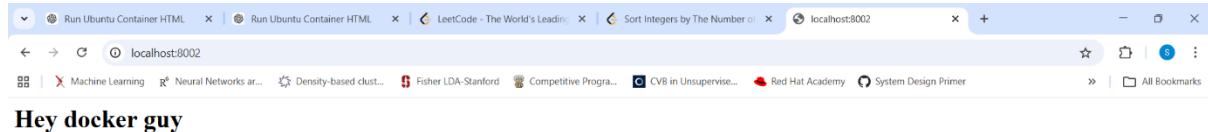

RAM 1.15 GB CPU 0.08% Disk: 6.18 GB used (limit 1006.85 GB)
>_ Terminal ○ Update available
```

```
Terminal
PS C:\Users\sreev\mysite> docker run -it --name mywebs -p 8002:8000 -v C:\Users\sreev\mysite:/app ubuntu bash -c "apt update && apt install python3 -y && cd /app && python3 -m http.server 8000"

2) Containerized Deployment of Apache HTTP Server with Port Mapping and Volume Binding

The screenshot shows two terminal windows and a browser window. The top terminal window runs a Docker command to update an Ubuntu container and then starts an Apache server on port 8003. The bottom terminal window shows the configuration of the Apache server. The browser window displays the text "Hey docker guy" at the address localhost:8003.

```
PS C:\Users\sreev\mysite> docker run -t --name apachepract -p 8003:80 -v ${PWD}:/var/www/html ubuntu bash

RAM 1.05 GB CPU 0.08% Disk: 8.45 GB used (limit 1006.85 GB)

```

The terminal shows the execution of 'apt update' on the 'myapache' container. It lists several packages being downloaded, including 'jammy', 'jammy-security', 'jammy-updates', and 'jammy-backports' from the official Ubuntu repositories. The terminal window has a dark theme with a sidebar on the right containing icons for search, copy, and delete.

```

Terminal
